                                                                "min_new_tokens": 10,
"temperature": 0.5,
                                                                "top_p": 0.2,
"top_k": 1
                                                           }
                     The simplest form of
                                                           prompt = "The wind is"
                     prompting, in which you
                     provide a short text or phrase
                                                           response = llm_model(prompt, params)
                     to the model without special
                                                           print(f"prompt: {prompt}\n")
print(f"response : {response}\n")
Basic Prompt
                     formatting or instructions.
                     The model then generates a
                     continuation based on patterns
                     it has learned during training.
                                                           prompt = """Classify the following statement as true or false:
                                                                         'The Eiffel Tower is located in Berlin.
                                                                    Answer:
                     A technique in which the
                     model performs a task without
                                                           response = llm_model(prompt, params)
                     any examples or prior specific
                                                           print(f"prompt: \{prompt\}\n")
                                                           print(f"response : {response}\n")
                     training on that task. This
Zero-shot Prompt
                     approach tests the model's
                     ability to understand
                     instructions and apply its
                     knowledge to a new context
                     without demonstration.
                                                           params = {
                                                                "max_new_tokens": 20,
                                                                "temperature": 0.1,
                                                           prompt = """Here is an example of translating a sentence from English to French:
                                                                    English: "How is the weather today?"
                                                                    French: "Comment est le temps aujourd'hui?"
                     Provides the model with a
                     single example of the task
                                                                    Now, translate the following sentence from English to French:
                     before asking it to perform a
                                                                    English: "Where is the nearest supermarket?"
                     similar task. This technique
One-shot Prompt
                     gives the model a pattern to
                     follow, improving its
                                                           response = llm_model(prompt, params)
                     understanding of the desired
                     output format and style.

                                                            chain = (
                                                                RunnableLambda(format_prompt)
                                                                  11m
                                                                StrOutputParser()
                     A class from
                     langchain_core.output_parsers
                     that simply extracts string
                                                            // Run the chain
                     outputs from LLM responses.
                                                            response = chain.invoke({"variable": "value"})
StrOutputParser
                     It's commonly used as the
                     final step in a LangChain
                     chain to ensure a clean string
                     is returned.
                                                            // Basic LCEL pattern
                                                                RunnableLambda(format_prompt) # Format input
                                                                  11m
                                                                                                 # Process with LLM
                                                                StrOutputParser()
                                                                                                 # Parse output
                                                            // Run the chain
                                                            result = chain.invoke({"variable": "value"})
                                                            // More complex example
template = """
                                                                Answer the {question} based on the {content}. Respond "Unsure about answer" if not sure.
                     LangChain Expression
                                                            Answer:
                     Language (LCEL) is a pattern
                     for building LangChain
                                                            prompt = PromptTemplate.from_template(template)
                     applications using the pipe
                     operator (|) for more flexible
                                                            qa_chain = (
LCEL Pattern
                     composition. It offers better
                                                                RunnableLambda(format_prompt)
                     composability, clearer
                     visualization of data flow, and
                                                                StrOutputParser()
                     more flexibility when
                     constructing complex chains.
                                                            answer = qa_chain.invoke({
                                                                "question": "Which planets are rocky?", "content": "The inner planets are rocky."
